We are working on BDD framework,

POM pages will be in com.mediacorp.pages package under src/main/java source folder

Utility classes(like Web_constant,EventUtility,RepositoryUtility,Utilities class) are in
com.mediacorp.utils package under src/main/java source folder

**StepDefination** and **TestRunnerclasses** are in src/test/java source folder.

StepDefn classes have step implementation of feature files . We can get steps in console by executing the feature file, we need to paste those steps in stepdefn class and need to provide implementation for those steps.

Features files are in src/feature/ java source folder, here we are writing scenario based test cases using common english language(Gekin keywords).

We are created one folder named as Object Repository there we are storing the all web-elements of the page

We are adding the web elements to the pages in form of
<webelementName locator="locatorName" value="locator value" />
